

Texas Housing Prices: beamer_presentation

Alison Hill

Packages and data

The txhousing data is available when you install and load the ggplot2 package.

```
library(tidyverse)
txsamp <- txhousing %>%
  filter(city %in% c("Houston", "Fort Worth", "San Antonio"))
```

Austin is expensive

```
ggplot(data = txsamp, aes(x = sales, y = median)) +  
  geom_point(aes(colour = city)) +  
  scale_colour_viridis_d("City\nCenter", option = params$w
```

Austin prices on the rise

```
ggplot(data = filter(txsamp, city == "Austin"), aes(x = sale_price)) +  
  geom_point(aes(colour = year)) +  
  scale_colour_viridis_c("Austin by year", option = "magma")
```

Fort Worth has more affordable housing

```
library(scales) # to make y-axis in non-scientific notation
ggplot(txsamp, aes(x = median, fill = city)) +
  geom_histogram(aes(weight = sales), position = "dodge",
  scale_fill_viridis_d(option = params$viridis_palette)+
  scale_y_continuous(labels = comma)
```

The current pace of sales is fast

“Months inventory”: amount of time it would take to sell all current listings at current pace of sales.

```
ggplot(data = txsamp, aes(x = year, y = inventory, colour =  
  geom_point() +  
  geom_smooth(se = FALSE) +  
  scale_colour_viridis_d("City\nCenter", option = params$vi
```
